

Bare-faced cheat: Women 'better at hiding infidelity'

<p>Notes &amp; Cues:</p>	<p>Article:</p> <p>You can't hide your lying eyes: scientists have revealed that women can judge whether a man is likely to be unfaithful just by looking at his face but men are less able to spot a cheating woman.</p> <p>Researchers at the University of Western Australia took a group of 1, 500 people and showed them pictures of 189 Caucasian adults (101 men and 88 women), having first asked them if they had been unfaithful to their partners.</p> <p>Respondents were then asked to rank these faces on a scale of one to 10, where one is "not at all likely to be unfaithful" and 10 is "extremely likely" to play the field.</p> <p>The result, published in the journal Royal Society Open Science, was that "taken together, both men and women showed above-chance accuracy for men's faces but not women's faces. Therefore, perceived unfaithfulness may indeed contain some kernel of truth in male faces".</p> <p>What makes women suspect men might sleep around?</p> <p>According to the survey, it mainly boils down to perceived masculinity, although the researchers came up with another unexpected result, suggesting it's not the best-looking men that play away the most.</p> <p>Despite the findings, one of the scientists involved in the report cautioned against jumping to conclusions on a first date.</p> <p>Although men are marginally more likely to betray infidelity with their features, it is still difficult to spot possible cheats from one individual's face, said Yong Zhi Foo.</p>
