

## ‘When we dream, we have the perfect chemical canvas for intense visions’

<b>Notes &amp; Cues:</b>	<b>Article:</b> <p>Alice Robb is an American science journalist who has written for the Washington Post and the New Republic. Her new book, <i>Why We Dream</i>, encourages us to rethink the importance of dreams and to become dream interpreters ourselves.</p> <p>Recently there’s been a massive interest in the science of sleep. Sleep plays a role in maintaining our mental health. Are dreams part of that process?</p> <p>Dreams play a big role in helping us cope with stress, grief and trauma. Dreams are an opportunity to work through things that frighten us in real life, to play out worst-case scenarios in an environment where they have no consequences.</p> <p>Has anyone explained why dreams contain such surreal elements, weird collages of time, people, geography and so on?</p> <p>When we dream, the logic centres of our brain — the frontal lobes — go dark, and chemicals associated with self-control, like serotonin and norepinephrine, drop. At the same time, the emotion centres light up: we have a perfect chemical canvas for dramatic, psychologically intense visions.</p> <p>You say neglecting to consider our dreams is like “throwing away a gift from our brains without bothering to open it.” What is the gift?</p> <p>When we’re dreaming, we’re thinking in a state we never have access to by day. Dreams offer the opportunity to think in a different way and show new answers to problems. They show us blind spots, help us home in on things we might be neglecting in our personal lives.</p>
